This book gives a lot of technical data about firing, which is exactly what I was hoping for. Specifically, I wanted to learn about a venturi stack, and the explanation was great. For anyone who wants to build a kiln, or for kiln owners who want to diagnose problems, this book is for you. Electric kiln users need not apply.

Great book with loads of information . . . most helpful! Lots of diagrams and measurements that give a far more accurate picture of kilns and firing than most books out there, and a good resources list at the back.

The Art of Firing explores building and firing a fuel kiln from top to bottom. This is a book that I would not ever be without! *Expansive diagrams of kiln designs *Comprehensive explanations of construction, draft, burners, and more *Sections on wood firing, salt glazing and refractory materials Firing a gas or wood kiln can be like a dance, causing you to stretch more than you intended sometimes, and often leaving you with sore muscles, but a glorious sense of having

accomplished something incredible. However, in the midst of that dance is the serious problem of getting your kiln to fire to the top of your firing range. There is nothing more frustrating than to have a stalled kiln! Before you are trying everything you can think of and there is nothing you can do to move that temperature up that last 100 degrees, buy this book! See my complete review at [...]

This book is packed with almost anything you might want to know on a variety of kilns and firing techniques. This book is a must have for anyone interested in firing, building, or experimenting with their own kilns.

Very useful, short text on building, and firing kilns. It has been added to my list of books that I think all ceramic artists **MUST** have! In addition with Rhodes book on Kiln firing it is an invaluable source of information on kiln mechanics.
